GEORGE GRAVES, Friend of the Home Gardener

Solid background of information and amiable, easy-going, presentation combine in George Graves' "Home and Garden News" program, broadcast over station WCOP (1150 on your dial), and WCOP-FM, (100.7 megacycles), Monday through Saturday, 6:50 to 7:00 a.m. The program has been airing on WCOP going on four years, and is followed by a loyal and responsive audience of home gardeners who swear by Mr. Graves' facts and radio personality.

Mr. Graves is a nationally recognized expert in the field of horticulture and floriculture and is known as author, lecturer, researcher and advisor. Again this year Perry's is glad to be a participant in bringing the benefit of all this background and knowledge to WCOP listeners through "Home and Garden News."

Mr. Graves gives special attention to the problems of the home gardener and home owner as to what and when to plant, how to landscape, how to control insect pests, etc. When the Spring planting rolls around, Mr. Graves' program should be a must for helpful information, and, once sampled, it will be a must for good listening as well.

Lay the roots flat in trenches, spreading them well, taking care to have the crown in an upright position. The crowns should be about 6 inches below the level of the bed. Cover lightly at first, gradually filling the trenches as the plants grow.

Midget Corn Is Ideal for the Home Garden. Try It This Year.

For limited garden spaces we recommend dwarf varieties like Golden Bantam Corn

SWEET CORN

Postpaid at pound prices. For larger quantities by Parcel Post, add postage

Culture—Plant about May 15th and in succession every two weeks up to July 14th. Drop six kernels to a hill. Let the hills be 3 feet apart each way for dwarf sorts and slightly more for tall varieties. Sometimes Corn is sown in rows 3 feet apart, allowing 10 inches between the individual plants. Three or more rows should be planted, however, either way in order to secure cross pollination.

Hybrid Varieties

The greatest improvement in Sweet Corn in recent years is the development of these hybrids that outyield all others and are also resistant to Stewart's disease. We caution our customers against saving their own seed for planting as Hybrid Corn will not give best results unless carefully crossed each year by experts.

PEAS

Plant 2 lbs. per 100 feet; about 100 lbs. per acre

Culture—Peas can be planted as early in the Spring as the ground can be worked. Broadcast in furrows 6 to 8 inches wide and 30 inches apart so that 1 lb. will plant 50 feet. Cover seed $1\frac{1}{2}$ to 2 inches deep. Good, rich loam is required for the best success. Apply Land Lime if necessary, as Peas do not thrive on acid soil. Make the first sowing as early as possible and follow up with subsequent plantings to insure a continuous supply throughout the season. For later sowing we recommend the earlier varieties. As Peas are legumes, it is well to inoculate the seed with Legume Aid which will result in sturdier growth and greater yield. Garden size package, sufficient to inoculate up to 8 lbs. of seed 10c. Simple and easy to use. Complete directions with every package. Be sure to include one with your order.

Postpaid at packet and pound prices. For larger quantities by Parcel Post, add postage at Zone rates

Get the utmost from your garden by planning successive crops—one to be put in as soon as another has matured. Some suggestions are:

Late Cabbage plants after early Peas; Celery plants (early or late varieties) after late Peas; Giant Straightneck Summer Squash after early Lettuce; Fordhook Bush Limas after Spinach, Lettuce or Radishes; Bush "Snap" Beans, either green or wax podded, after early Beets; Crosby Beets after early string Beans; Kale after early Onions from sets; Turnips after Peas; Cucumbers for pickles after Lettuce, Radishes or Spinach; or, if you prefer, plants of Peppers and Eggplants after these crops. Of course, it is possible to grow quick maturing crops like Radishes and green Onions from sets on ground that will later be required by Cucumbers, Melons and Winter Squash, these being vegetables that need not be planted until well into June.

PERRY'S SHADY SPOT LAWN SEED

There's no better mixture for sowing on the north side of buildings, between houses or under shade trees receiving sunshine less than half the day

Our Shady Spot Lawn Seed is blended from the best grasses possible to obtain for this purpose, only those that grow and flourish under shady conditions in their natural and wild state being used. It is always advisable for those who are seeding down shady places to supply new soil, if possible, especially if large trees are producing the shade, as their roots spread so fast as to quickly exhaust its nourishment. Liberal amounts of fertilizer are as necessary for lawns under shade trees as are plenty of seed and water. Trimming to allow more air and light is frequently helpful.

½ lb. 60c., 1 lb. \$1.15, 5 lbs. \$5.65, 10 lbs. \$11.00, 25 lbs. (1 bu.) \$17.25, 50 lbs. \$53.00, 100 lbs. \$105.00

Blended for adverse conditions and to produce a fine, smooth, velvety sod of a beautiful rich green. Broadcast 50 lbs. of 6-8-2 Fertilizer to each 1000 square feet and rake in lightly. Sow 1 lb. of our Bank and Terrace Mixture to each 250 to 300 square feet and rake again lightly and firm with a roller or the back of a spade. On steep slopes it may be well to sow a quart of seed oats to each 2 lbs. of seed to help temporarily to retain the surface.

PERRY'S SEASHORE LAWN GRASS MIXTURE

Many a lawn along the New England Shore has been grown from this mixture

A rich, green lawn is especially appreciated and desirable at the seashore, but usually conditions are decidedly unfavorable. Sandy soils are benefited by the addition of clayey soil, peat moss and other organic matter resulting from the use of Wizard Brand Cattle and Sheep Manures. Top soil to the depth of 4 inches should be broadcasted, as grass will not grow well in pure sand. The grasses used in our Seashore Mixture are adapted to unfavorable conditions, will quickly germinate in the top soil and make strong roots which will reach down into the sand for moisture. In order, however, to keep the seashore lawn in good condition it should be watered liberally each evening and also receive an occasional application of our sterilized Sheep Manure to maintain a supply of quickly available plant food. Sow 1 lb. to every 250 square feet.

½ lb. 60c., 1 lb. \$1.10, 5 lbs. \$4.90, 10 lbs. \$9.60, 25 lbs. \$23.50

PERRY'S PUTTING GREEN MIXTURE

For an Ideal and Lasting Turf

This is an extra fine lawn grass mixture that will produce at home a turf as fine as on the putting greens of golf clubs. We recommend it highly and suggest when sowing to prepare the soil and fertilize it in the usual way. In order to secure even distribution, divide the seed and broadcast one-half each way of the lawn, allowing 1 lb. to every 150 to 250 square feet.

Sunshine Asters Are Gay and Charming

PERRY'S PRIZE ASTERS

WILT-RESISTANT STRAINS. Wilt most commonly occurs in the hot Midsummer months just as the buds are beginning to open. The plant wilts, the leaves first turn yellow, then brown and curl, finally dying. The remedy is to use Wilt-resistant Strains that have proven so valuable that wherever available we offer them to the exclusion of others. Plants grown from Wilt-resistant Strains are not immune to the disease known as Aster "yellows," which is quite different and is transmitted by insects. However, they are not so susceptible to infection from it as they have a sturdier constitution. Varieties marked with asterisk (*) are Wilt-resistant.

BIRD SUB-IRRIGATOR

Simplified Sub-Irrigation of Flats

Sub-irrigation is not a new idea. The Bird Sub-Irrigator is a simple and practical application of this principle which has been known for many years. The Bird Sub-Irrigator is a waterproof, fiber resin tray ¾ of an inch deep, serving as a reservoir in the bottom of the flat. It is filled with crushed stone, screened gravel or cinders to allow free flow of water under the soil.

A small clay pot serves as a watering vent permitting water to flow into the drainage without directly wetting the soil. Capillary action draws the moisture slowly and evenly up into the soil as the seedlings or plants require it, thus helping to control damping off and insuring faster growth, better plants and higher yield.

Made to fit our regularly stocked greenhouse flat, 20x12x3 inches. 15c. each

CARBOLA with DDT

Carbola is primarily a powerful disinfectant that kills certain germs by contact which cannot be seen by the naked eye. This germ killer is combined with a snow-white pigment, same as used in all best oil paints. Thus, when Carbola is applied, it kills invisible germs by contact and dries white all in one easy operation. It can be sprayed or brushed on.

Carbola comes in powder form to which only cold water is needed to make a paint.

Carbola powder, just as it comes in the handy, clean packages, also makes an ideal dry disinfectant. The dry dusting method of disinfecting is considered very practical, especially for floors, dropping boards, nests in poultry houses, etc. where moisture is to be avoided.

Carbola comes in powder form, ready to use. Just mix with any water and apply with brush or spray. Will not clog sprayer.

FRANKLIN PARK LAWN SEED

TRADE MARK REGISTERED

The Best Mixture for Sunny Lawns

Every good lawn begins with good seed. **Franklin Park Lawn Seed** is good seed. It is recognized as a quality mixture for those who want the best. We blend it ourselves fresh every season from heavy, re-cleaned, live seeds of only those grasses known to be adapted to most all of our soils and climate. A small amount of White Dutch Clover is included. It is free from worthless chaff and dirt. It is high in germination, as tests will prove, and complies with the Massachusetts seed law. **Franklin Park** is used extensively on lawns of fine homes and large estates, in parks and cemeteries all over New England. Under ordinary conditions, 1 lb. (1 qt.) is sufficient to properly seed 250 to 350 square feet.

½ lb. 60c., 1 lb. (1 qt.) \$1.15, 5 lbs. \$5.65, 10 lbs. \$11.00, 16 lbs. \$17.40, 32 lbs. (1 bu.) \$34.50, 100 lbs. \$105.00

HINTS ON LAWN PREPARATION AND IMPROVEMENT

Probably we receive more requests each season for help in lawn making and improvement than on any other subject connected with gardening, so we print the following information in hopes that it will answer many of them, though we recognize that practically every lawn presents an individual problem.

Nothing can replace thorough preparation—spading deeply to loosen the soil well—raking to free it from refuse of all kinds and to pulverize it finely—careful grading—enriching sufficiently, and seeding with ample amounts of good seed.

Deep spading improves the mechanical condition of the soil, permitting the tiny roots to penetrate deeply, and secure a maximum of soil food and water. It must be finely pulverized to make a good seed bed. Top soil (preferably a sandy loam) should be spread only on properly prepared sub-soil. Rake well to carefully grade, and always uphill on banks and terraces.

If the soil is known to be sour (acid), apply Land Lime to the rough grade and rake in before spreading either fertilizer or lawn seed. As insurance against the injurious grubs of June bugs and Japanese Beetles, dig in also 8 lbs. of Arsenate of Lead to each 1000 square feet. Broadcast at least 25 lbs. of good plant food like Bonemeal or 7-7-7 to each 1000 square feet, especially under trees.

When sowing your seed, be sure you broadcast it evenly. (A Cyclone Seeder will save seed, time and patience on large areas). Roll, if not sticky, with a water

weight roller to settle the seed uniformly and make the lawn smoother and more presentable. On small spaces simply raking will answer. We advise watering at night or early morning—not when the sun shines. Cut the grass frequently with a sharp lawn mower after it first gets about 3 inches high.

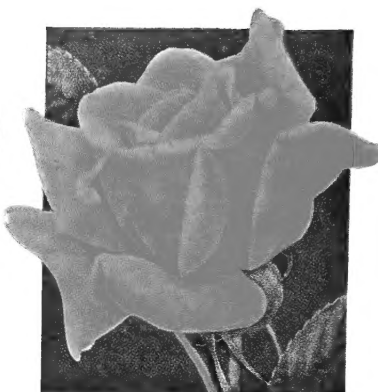

The right kind of a lawn is luxuriant and thick and practically free from weeds. Where do weeds in the lawn come from? Only properly sterilized soil is entirely free from weeds seeds. Some may come with top-soil brought in, or from composts not thoroughly rotted, others are carried by the wind and birds, but more are sown each year in impure lawn seed. To secure a maximum of good seed we urge you to buy only Perry's high grade lawn mixtures. But when weeds do appear, dig them out promptly. Scatter in small amounts of additional seed where weeds have been extracted. Always keep a package of Lawn Seed on hand for this purpose.

The first work in the Spring on established lawns is the removal of all litter that has collected during the Winter. With the lawn clean, fill in all hollows with good top soil, and scatter fresh lawn seed and fertilize as for new lawns. Then while the ground is still soft, roll with a water-weight roller—one that can quickly be made heavy or light, at will, to meet conditions. The earlier this work can be done, the better. A rolled lawn will be smoother and have a neater appearance, though repeated rollings may be injurious.
